

Plugins and Extensions

Terminal Plugin

- ❑ The Terminal plugin is used to execute commands in textual format (generally a black window).
- ❑ It works faster than the Graphical User Interface (GUI) methodology. It also has a broader scope in terms of authority and permissions
- ❑ In UiPath Studio, there is a NuGet Package called “Uipath.Termianl.Activites.Terminal activity is pre-installed in UiPath Studio”
 - ❑ Search for Terminal in Actitivites Panel.
- ❑ To install Terminal activity NuGet Package, click on the Manage Package icon,
- ❑ Search for UFSNJOBM in the search bar
- ❑ Install button will appear then click install

SAP Automation

- ❑ SAP automation with UiPath is integrated with the latest techniques that are more suitable for organizations
- ❑ SAP automation is becoming the buzzword in the IT industry.
- ❑ These days, error-prone databases and unfilled/partially filled documents are mostly discarded.

Advantages

- compatible with all the SAP automation techniques that are best suited to the organization.
- It is accurate (99.999 % of the time) and delivers the best results.
 - It avoids typical errors that humans make
- Human employees demand higher salary and consideration has to be given to (full-time employees) FTE too.
 - Modular Approach for FTE
- It is scalable.
 - Just set it up with hundreds of Robots and you do not have to monitor them. There is no need to constantly watch them. The Robots can work independently

Steps in SAP automation

- There are some situations when the Click activity fails to recognize the UI element.
- Click Text activity and Click Image activity are used when Click activity does not work in some situations while automating SAP
- There are some scenarios when we have to extract tabular data from SAP.
 - In such case use selectors to recognize the table cell.
 - You can implement a loop to iterate through each table cell.
- You can put your code inside a Try Catch activity and when an exception occurs
- While interacting with checkboxes and radio buttons, make use of Get attribute activity

- SAP automation is used are:
- 1. Filling in a form from any application.
- 2. Copying and pasting data between SAP and other applications.
- 3. Comparing data fields on the screen.
- 4. Updating the status of an entity in a system.
- 5. Scraping data from any application/websites.

Citrix Automation

□ In General

- We have previously dealt with common automations automating desktop applications or web applications.
- It is easy when we deal with these applications having graphical user interfaces.
- UiPath identifies the elements that we have clicked on and recognizes them.
- Thus, the next time the Robot executes a process, it successfully identifies the same element. We have already seen these types of action.
- Two problems when automating through the remote desktop connection:
 - 1. We cannot click on an image
 - 2. Sending the coordinates of an element to another machine is error-prone

- Well, UiPath Studio comes with an environment called Citrix.
- Using the Citrix environment, it becomes very easy for automation
- Activities that Citrix supports are:
 - 1. Click Image
 - 2. Click text
 - 3. Type
 - 4. Send hotkey
 - 5. Select and Copy
 - 6. Screen Scraping and Scrape Data
 - 7. Copy text

Citrix sample

- ❑ Click on the Recording icon at the top of UiPath Studio. Select the Citrix option. A window will pop up. Now navigate to Google and click on the Type activity from the pop-up menu:
- ❑ A pop-up window will be shown. Just type the text that you want to search for. Also, check the Empty Field option. Press Enter:
- ❑ It will again show you a pop-up window. Now select Click Image from the Citrix Recording activity. You have to select the whole search area of the Google search bar. This time, it will ask you to indicate a point on the screen.
- ❑ Click OK. Press Save & Exit and we are done.
- ❑ Run the file

Credential management

- In the Windows operating system, you can view your network login credentials, that is, the username and password, by using Credential Manager.
- With the help of UiPath Studio, you can automate the process of creating, manipulating, and deleting credentials using some credential activities:

☐ Add Credential activity:

- ☐ You can add a credential activity for use in your project. You just simply have to specify the username and the password.

☐ Get Credential activity:

- ☐ This activity is used to store the username and password for future use. It enables us to further check whether credentials are valid or not.

☐ Request Credential activity:

- ☐ This activity is used to display a dialog box to a user asking them about their credentials. It then stores the username and password in string variables that can be further used to log in to the applications.

☐ Delete credential activity:

- ☐ This activity is used to delete the credentials that we have stored
